## Common Questions

*Q: How do I install eeMimeType?*

A: Download the "eeMimeType" plugin and save it to a folder of your choice (for example, c:\webfiles\). It's not necessary to manually extract the \*.zip file, HTML-Kit will expand it to the proper folder during the installation.

Select "Install | Install Plugin" from HTML-Kit's "Tools" menu. Point to the downloaded \*.zip file and click "Open."

If any additional prompts appear, follow them to complete the installation.

*Q: How do I run it?*

A: Snips

eeMimeType's icon will appear on the "Snips" tab on HTML-Kit's Actions Bar. It can also be invoked from the "Actions | Snips" sub menu.

*Q: Which programming language was used to write it?*

A: eeMimeType was written in hkScript. More plugins written in hkScript can be found on the Plugins page.

*Q: What's the quickest way to uninstall eeMimeType?*

A: Right click the eeMimeType icon on the Actions Bar and select "Uninstall." Alternatively, the "Tools | Install | Uninstall Plugins" menu option in HTML-Kit can be used to uninstall this and other plugins.

*Q: Do I need the exact versions of software listed under the Requirements?*

A: The versions listed are the minimum versions required by this plugin. For example, a plugin that requires HTML-Kit Build 290 will run on HTML-Kit Build 292 as well.

*Q: What's the best way to check which version of HTML-Kit I'm using?*

A: The build number can be found on the "About" dialog, which is located on HTML-Kit's "Help" menu.

*Q: What's this requirement for hkScript?*

A: hkScript 290.1 requirement is only applicable to the users of the older HTML-Kit Build 290. Since the latest

version of hkScript is already included in HTML-Kit  
Build 292, the users of Build 292 can ignore it.
